

Access Control & Security

Step 1: Role Definition

The system allows creation of different user roles.

Examples include:

- Admin
- Manager
- Salesperson
- Technician

Each role defines the level of access within the system.

Step 2: User Role Assignment

Each user is assigned a specific role based on their responsibilities.

This ensures users receive appropriate access according to their job function.

Step 3: Role-Based Access Control

The system grants access to modules and features based on the assigned role.

Example:

- Admin → Full system access
- Salesperson → Access to leads and follow-ups
- Technician → Access to service tickets

This ensures controlled system access.

Step 4: Data Visibility Restrictions

The system restricts what data a user can view.

Examples:

- Salesperson can view only their assigned leads
- Technician can view only assigned service requests

This ensures data privacy and security.

Step 5: Read / Write Permissions

The system defines what actions a user can perform.

Permission types include:

- Read → View data only
- Write → Create or update data

This ensures proper control over data access and modifications.

Step 6: Secure Login

Users must log in using valid credentials such as username and password.

The system verifies user identity before allowing access, ensuring only authorized users can use the system.
